

Fictional Proposal: Najm Urban Mobility Smart Parking Response

Respondent: Najm Urban Mobility Systems

Tender reference: RMMO-SP-2026-014

Executive Summary

Najm Urban Mobility proposes a hosted smart parking operations platform with enforcement workflows, resident permit services, payment reconciliation, and live occupancy analytics for the five pilot districts.

Commercial Submission

Bid security: 2% of contract value, valid for 90 days from submission. Najm can extend the validity period if requested during clarification.

Product and Language Coverage

The operator portal and resident notifications are available in Arabic and English. The enforcement officer mobile interface supports Arabic labels, English labels, and right-to-left layout.

Availability and Support

The hosted service is designed for 99.5% monthly availability. Critical incident response is staffed 24/7 with a target human acknowledgement within 30 minutes. Standard support tickets receive response within 4 business hours Sunday through Thursday.

Security and Data Residency

Najm maintains an ISO 27001-aligned information security management system and completed an independent penetration test in March 2026. Production resident data will be hosted in a Riyadh cloud region under a KSA data residency commitment.

Delivery Plan

District configuration begins after contract award. Field integration and officer training run in parallel. Go-live is planned for 15 October 2026 after staged district acceptance.

Integrations

The platform integrates with municipal payment gateways through REST callbacks and signed reconciliation exports. Najm exposes REST APIs for occupancy, permits, violation status, and payment events.

Training

Najm includes role-based training for 40 municipal users across operations, finance reconciliation, enforcement supervisors, and system administrators. Additional training

seats can be priced separately.
